

MA2224 Quiz 3

October 20, 2021

Question 1 (12 pts)

The amount of time it takes for a computer program to invert a 2000×2000 matrix is normally distributed with a mean of 3.65 seconds and variance of 0.004.

- Determine the probability that the computer inverts a 2000×2000 in under 3.5 seconds.
- If the computer program must invert 15 such matrices in a row, what will be the distribution of the total run-time of the program (assuming independent sequential runs)?
- Determine the probability that this sequence of 15 runs takes more than 55 seconds.

Question 2 (8 pts)

A popular NYC club always has a long line waiting to get in. The average time a person stands on line 10 minutes. If we assume an exponential distribution for the waiting time of each person, determine the following

- The probability that a person who has been waiting 8 minutes will have to wait more than 15 minutes total to get in.
- The expected number of people it would take until a person is let in in under 3 minutes
