Do not distribute course material

You may not and may not allow others to reproduce or distribute lecture notes and course materials publicly whether or not a fee is charged.

Welcome to CS 4563

Thanks to:

- □Some of the material from this course is from Prof. Sundeep Rangan
 - This includes many of the slides, the outline of the course, the demos, the programming assignments (aka labs) and many of the written homework assignments
- □Some slides are from:
 - A. Zisserman, "Machine Learning Introduction"
 - Watt, Borhani, Katsaggelos, "Machine Learning Refined (Foundations, Algorithms, and Applications)

Prof: Linda Sellie

- o Tuesdays 3:30 5:00, and by appointment. Office hours will be in person iff I lecture in person. My office is room 848 on the 8th floor of 370 Jay Street
- The TAs for the course are Mei and Jerry. You can ask them questions on the NYU Brightspace Discussions forum, by attending office hours Do not email the TAs directly.
 - o TA's office hours: To be determined

Texts:

- Standford notes http://cs229.stanford.edu/syllabus.html
- o Deep Learning Chapter 5 https://www.deeplearningbook.org/contents/ml.html
- O Hands-On Machine Learning with Scikit-Learn and TensorFlow 2nd edition by Aurlien Gron. On line code https://github.com/ageron/handson-ml2
- o Machine Learning for Humans https://medium.com/machine-learning-for-humans/supervised-learning-740383a2feab

Grading:

- Midterm 1: 25%, midterm 2: 30%, end of semester quiz 10%; final project: 20%; Brightspace online quizzes: 5%; homework: 10%
- Homework assignments typically will have a written part and a programming part. The programming parts (Labs) will involve python-based exercises (many of the assignments are modified versions of Prof. Sundeep Rangan's labs)

Homework assignments will be turned in on Gradescope. The TAs will inform send more information later

Homework assignments that **are not** due just before an exam may be up to two days late, for a 10% deduction in your grade for each day. To make it easier to grade, typed homework assignments will be given a 5 point bonus

- Final project is done in groups of two
- Midterm exams and end of semester quiz are closed book. The online quizzes are open book, open notes. You must do your own work and you may have as many times a you would like before the deadline

Pre-requisites:

- One of: MA-UY 2224 (Data Analysis), MA-UY 2222 (Data Analysis 2) or EE-UY 2223 (Probability) or equivalent
- Undergraduate probability and linear algebra (MA-UY 2034, MA-UY 2034G, MA-UY 3044 or MA-UY 3054)
- o Programming experience is essential. CS-UY 1134 (Data Structures and Algorithms)

We will be coding up our algorithms in Python!

The schedule is tentative and subject to change. We may not get through all the material in this schedule.

- Introduction
 - Course logistics. Examples of machine learning problems used today. Formulate machine learning problems (identify task, data, objectives). Classify ML problems as supervised vs. unsupervised, regression vs. classification.
- Simple regression and multiple Linear regression
 - Least squares formula, Gradient Descent, Normal Equations Method
- Model selection and regularization: Identify the order in a multiple linear regression model
 - o Understanding underfitting and overfitting with polynomials; irreducible error; bias and variance tradeoff; cross validation; regularization techniques
- Logistic Regression
 - Gradient ascent
- Support vector machines (SVMs)
 - Maximum margin; duality; kernel methods
- Neural networks
 - o Formulation; back propagation
- Convolutional and deep networks
 - Convolutional layers; pooling layers
- PCA
 - Dimensionality reduction
- Clustering and K-Means
 - K-means; mixture models; EM methods
- TBA
- Final project presentations

Approach

- Understand the core algorithms of ML and how we can define them mathematically
- How to implement many of the algorithms from scratch
- Run many of the algorithms on real world datasets and evaluate how well they perform

Learning Objectives

- □Provide examples of machine learning used today
- □Classify a machine learning task:
 - Supervised vs. unsupervised, regression vs. classification
- □For supervised learning, identify the features/predictors and labels/target variables
- □Given a new problem, qualitatively describe how machine learning can be used
 - Formulate a potential machine learning task
 - Identify the data needed for the task
 - Identify objectives

Topic 1 What is Machine Learning?

INTRODUCTION TO MACHINE LEARNING

Outline

- □What is Machine Learning?
- □Types of machine learning algorithms
 - Supervised learning
 - Classification
 - Regression
 - Unsupervised learning
- □Why the hype today?

"Machine learning is a field of computer science that gives computers the ability to learn without being explicitly programmed."

https://en.wikipedia.org/wiki/Machine_learning

"A computer program is said to **learn** from experience E with respect to some class of tasks T and performance measure P if its performance at tasks in T, as measured by P, improves with experience E."

Tom M. Mitchell, CMU

Task	Performance Measure	Experience /		
Predict if email is spam	% of misclassified emails*	A set of In-Class exercise spam and Identify a Task, Performance measure, Experience		
Predict how much a stock price will change tomorrow	Squared difference between true price and predicted price	Historical stock prices A set of		
Read a handwritten digit	% of misclassified digits	handwritten digits with the correct digit ₁₀		

Why Machine Learning?

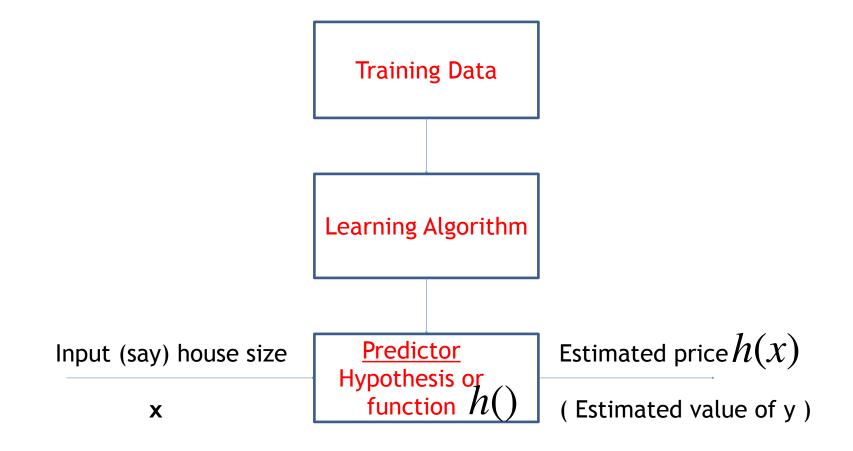

- Goal: Computers that "learn" from data or experience
- Where useful:
 - Human expertise does not exist (navigating on Mars)
 - Humans are unable to explain their expertise (speech recognition, driving)
 - Solution changes in time (routing on a computer network)
 - Solution should be customized to user (targeted advertising)

Input (say) house size

Predictor
Hypothesis or function h()

Estimated price h(x)

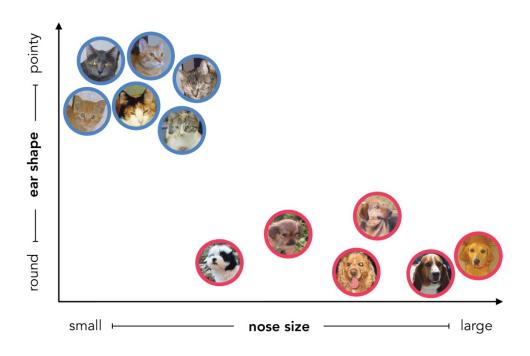

(Estimated value of y)

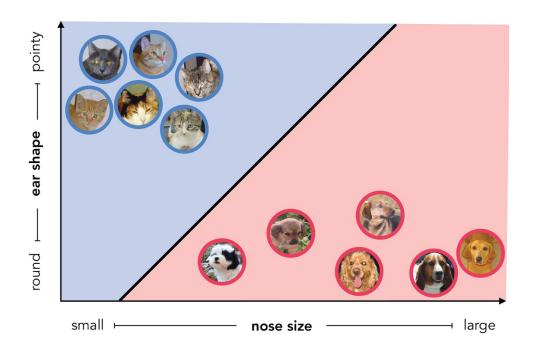

Watt Borhani and Katsaggelos_Fig1_01

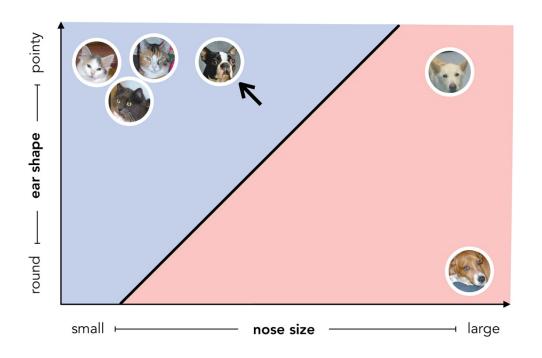

Feature engineering

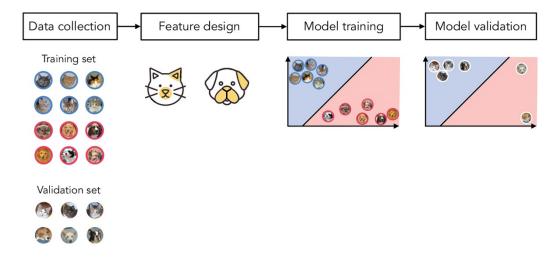

Watt Borhani and Katsaggelos_Fig1_04

Outline

- □What is Machine Learning?
- □Types of machine learning algorithms
 - Supervised learning
 - Classification
 - Regression
 - Unsupervised learning
- □Why the hype today?

Types of learning we will cover

- Supervised Learning -
 - Classification
 - Regression
- Unsupervised Learning ¬

- Goal is to predict a specific value
- Training examples have labels
- Direct evaluation of accuracy
 - Goal is to "understand" the data (structure/patterns)
 - Training examples don't have labels
 - Evaluation is less direct
 (qualitative or effect on another algorithm which can be measured directly)

Supervised learning goal:

Having observed a set of examples (input and output), create an rule for predicting the output for an unseen input

Supervised Learning (Continued)

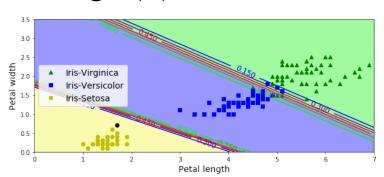

Types of Supervised Learning:

- 1. Regression: When the value to be predicted is a continuous/quantitative e.g. predicting the map of a car, predicting price of house, predicting tomorrow's temperature in a weather predicting problem etc.
- 2. Classification: When the value to be predicted is a categorical/qualitative value

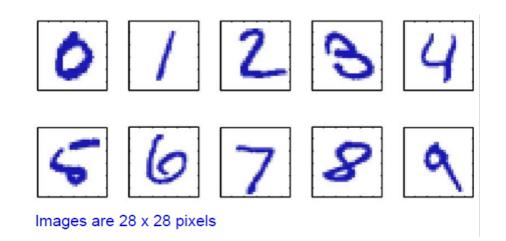

e.g. which type of iris, whether a mail is spam(1) or not-spam (0), whether image contains a human face(1) or not (0) or whether a transaction is fraudulent(1) or not (0). This 1 or 0 is known as the class.

There can be more than 2 categories. This is known as multi-class classification. E.g. whether an image contains apple(0) or orange (1) or

mango (2).

Example: Digit Recognition

8x8 matrix for 0

					U
00	513	91	[00		513
00	1315	1015	50		91
03	152	011	80		0
04	120	08	80	$\mathbf{x} =$	0
05	80	09	80		:
04	110	112	70		613
02	145	1012	00		100
00	613	100	00		L 0_

- ☐ Recognize a digit from the image
- \square Learn a function $f(x) \in \{0,1,...,9\}$, x is a 28 x 28 matrix
- ■Expert systems do not work well:
 - \circ You can recognize the digits, but difficult to program a function f(x) that works well
 - Try it!

 $\mathbf{0}$

Supervised Learning

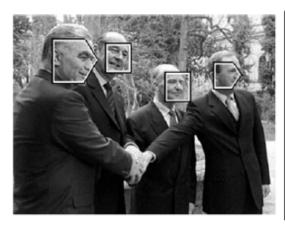

- □Start with training data
- □Ex: 6000 examples of each digit
- Learn a classifier that matches label well on training data
- □Given new data use function to guess digit
- □In 1/20/2018 systems got <0.21% errors http://rodrigob.github.io/are_we_there_yet/build/classification_datasets_results.html#4d4e49 5354
- □First commercial application:
 - Used by USPS for recognizing zip codes on letters

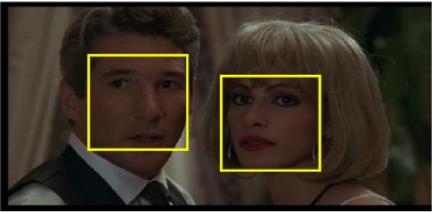

Training examples

Each sample must be labeled by hand who knows truth

Example: Face Detection

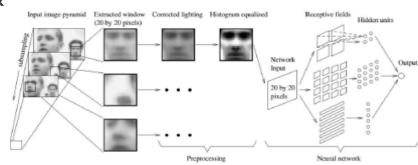

- □Also a supervised learning problem
- □ For each image region, determine if
 - Face or non-face

Face Recognition

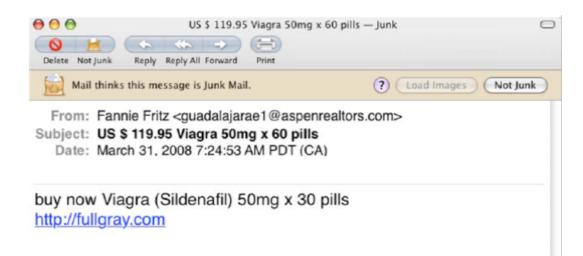

- □Typical early face recognition datasets:
- **□**5000 faces
 - All near frontal
 - Vary age, race, gender, lighting
- □ 10⁸ non faces
- □ Faces are normalized (scale, translation)
- "functions" that work well may be very complex
- ☐Many more datasets are available now:
 - See http://www.face-rec.org/databases/
 - You can use this for your project!

Rowley, Baluja and Kanade, 1998

Example: Spam Detection

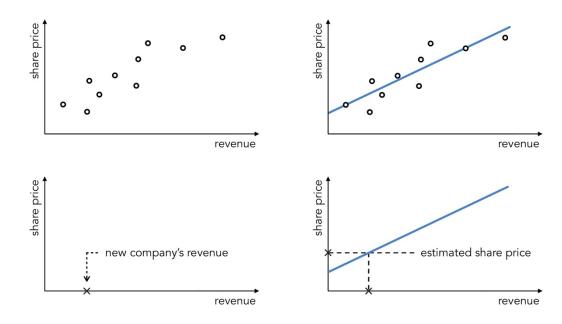

- □Classification problem:
 - Is email junk or not junk?
- □For ML, must represent email numerically
 - Common model: bag of words
 - Enumerate all words,
 - Represent email via word count num instances of word
- □Challenge:
 - Very high-dimensional vector
 - System must continue to adapt (keep up with spammers)

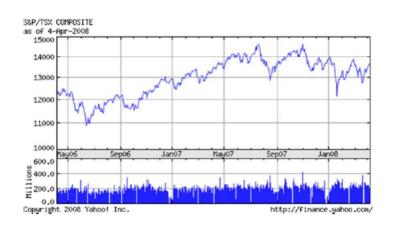

Supervised Learning - Regression

- Regression: The output variable (also called target variable or dependent variable) to be computed is a continuous valued.
- The input variable is called a feature or independent variable or predictor.
- There can be more than 1 features. Eg: We need to predict tomorrow's tempature if we are given humidity level, wind speed and other features.
- To predict, machine learning algorithm will learn a mathematical function(hypothesis) which can be used to predict the value of output variable.
- Example of regression algorithms are: linear regression, polynomial regression etc.
- Eg: Linear function: $y = w_0 + w_2 x$ Find the values of w_0 and w_1 from the data.

Example: Stock Price Prediction

- □Can you predict the price of a stock?
- □What variables would you use?

Supervised learning goal:

Given $(\mathbf{x}^{(1)}, y^{(1)}), (\mathbf{x}^{(2)}, y^{(2)}), \dots, (\mathbf{x}^{(N)}, y^{(N)})$ digit recognition -

Find: A good approximation to $f: \mathcal{X} \to \mathcal{Y}$

where χ is the input space

 ${\mathcal Y}$ is the output space

Examples:

pixels -> {0,1,2,3, 4, 5,6,7,8,9}

face detection -

pixels -> {Face, Not a Face}

Spam detection-

email -> {Spam, Not Spam}

Stock Price Prediction-

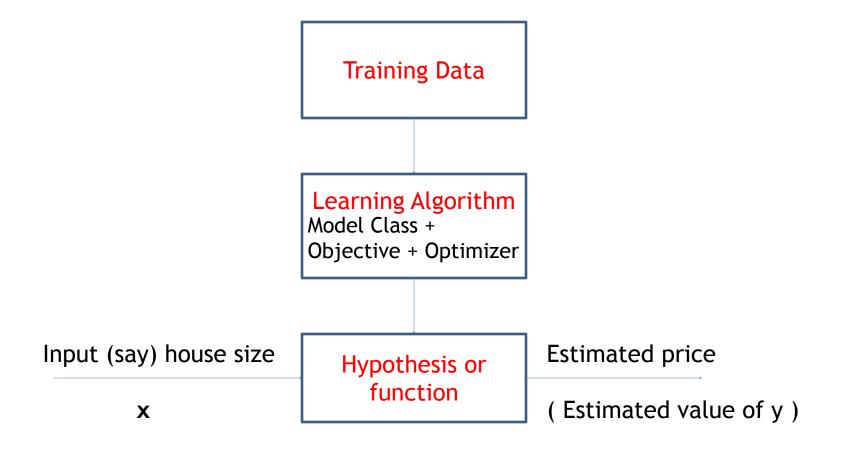

historical prices, interest rate, etc -> \mathbb{R}

Classification problem: If the output is categorical/ quantitative

> Regression problem: If the output is continuous/ quantitative

Supervised Learning

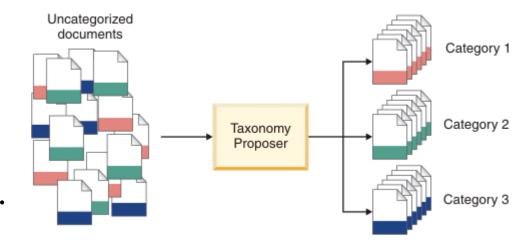

Unsupervised learning goal:

Having observed a set of examples (input only)

- group the examples into clusters
- Reduce the number of dimensions in the dataset

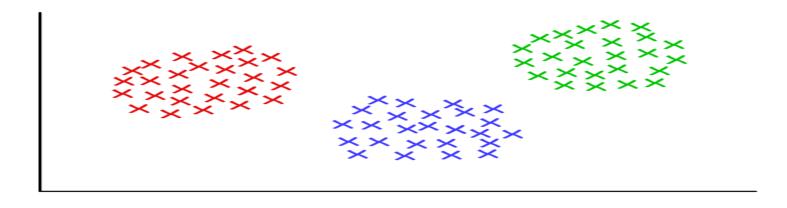

Unsupervised Learning

- Here no output variable or label is to be predicted.
- Only features are given and we need to find some pattern in data. E.g. say we are given some news articles and we need to cluster these articles into 2 clusters. This is known as clustering.
- We don't know in advance whether which article belongs to which cluster.
- We just cluster them based on similarity in the features.
- Now, if we have a new article, we can tell by it's text that which cluster it belongs to.
- There can be more than 2 clusters.

Example: Document classification http://www.ibm.com/support/knowledgecenter /SSBRAM_8.7.0/com.ibm.classify.ccenter.doc/c_WBG_Taxonomy_Proposer.htm

Unsupervised Learning (continued)

• Some examples of clustering are:
Organize computing clusters, social
network analysis (e.g. grouping Facebook
users based on their interest, or activities
to target advertisements), market
segmentation etc.

of early and the

There are many other types of machine that we will not cover

ML is a big field!

E.g.

- semi-supervised Learning
- reinforcement Learning

Outline

- □What is Machine Learning?
- □Types of machine learning algorithms
 - Supervised learning
 - Classification
 - Regression
 - Unsupervised learning
- □Why the hype today?

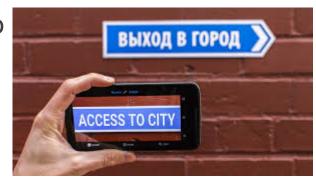

Machine Learning in Many Fields

- □Retail: Market basket analysis, Customer relationship management (CRM)
- □Finance: Credit scoring, fraud detection
- ☐ Manufacturing: Control, robotics, troubleshooting
- ☐ Medicine: Medical diagnosis
- □Telecommunications: Spam filters, intrusion detection
- □Bioinformatics: Motifs, alignment
- □Web mining: Search engines
- **...**

What ML is Doing Today?

- □Autonomous driving
- **□**Jeopardy
- □Very difficult games: Alpha Go
- Machine translation
- ☐Many, many others...

Why Machine Learning is in Hype from the past few years?

- There are 3 main factors behind recent increased applications of ML:
- 1. Data: There has been a huge amount of data generated in the past decade and continuously increasing due to internet, massive storage, digitalization etc.
- 2. Computation Power: Hardware advance like GPU's, distributed machines etc.
- 3. Algorithmic Innovation: New and optimized algorithms by ML and AI research Community.

Exercise

- □Break into small groups
- □Take a field that interests you:
 - Ex. Driving a car, understanding social networks, recommend a movie to watch, ...
- □Identify a specific task that can be done with machine learning
 - What is the objective of the task?
 - What is the data you need?
 - What type of ML problem is this? Classification, regression, ...
 - How would your approach compare to an expert-driven method?
